

Searching (part 2)

October 18, 2006

ComS 207: Programming I (in Java)
Iowa State University, FALL 2006
Instructor: Alexander Stoytchev

Homework #7 Hints

- For the first 2 problems:
 - Instead of entering the numbers you can use the random number generator.
- Matrix multiplication
- Other Questions?

Problems with Input

```
Scanner scan = new Scanner(System.in);  
  
String line = scan.nextLine();  
int num = Integer.parseInt(line);  
  
String line2 = scan.nextLine();
```

HW Hints: Matrix Multiplication

$$(AB)_{12} = \sum_{r=1}^4 a_{1r}b_{r2} = a_{11}b_{12} + a_{12}b_{22} + a_{13}b_{32} + a_{14}b_{42}$$

[http://en.wikipedia.org/wiki/Matrix_multiplication]

HW Hints: Use Google™

- For example, if you don't know what standard deviation is just Google it!

Arrays in Java

- Java represents 2D arrays as an array of arrays!
- In other words, a 2D integer array is really a 1D array of references to 1D integer arrays.
- The concept generalizes to N-dimensions

Two-Dimensional Arrays

Expression	Type	Description
<code>table</code>	<code>int[][]</code>	2D array of integers, or array of integer arrays
<code>table[5]</code>	<code>int[]</code>	array of integers
<code>table[5][12]</code>	<code>int</code>	integer

Example of a regular 2D array

Note: In Java the first index should be 0 not 1!

[<http://web.ics.purdue.edu/~cs154/lectures/lecture011.htm>]

Linear Search

- The most basic
- Very easy to implement
- The array DOESN'T have to be sorted
- All array elements must be visited if the search fails
- Could be very slow

© 2004 Pearson Addison-Wesley. All rights reserved

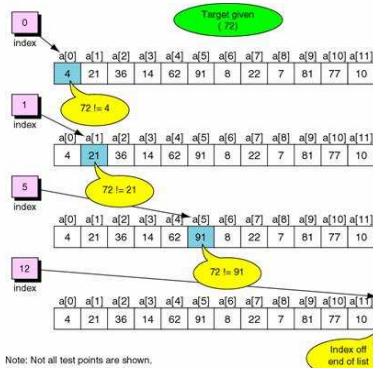

Example: Successful Linear Search

Java Example: Finding the index of a number in a sorted array of integers using linear search

© 2004 Pearson Addison-Wesley. All rights reserved

Target: 22

a[0]	a[1]	a[2]	a[3]	a[4]	a[5]	a[6]	a[7]	a[8]	a[9]	a[10]	a[11]
4	7	8	10	14	21	22	36	62	77	81	91

22 > 21

© 2004 Pearson Addison-Wesley. All rights reserved

Example: LinearSearch_InSortedArray.java

© 2004 Pearson Addison-Wesley. All rights reserved

Analysis

- If the list is unsorted we have to search all numbers before we declare that the target is not present in the array.
- Because the list is sorted we can stop as soon as we reach a number that is greater than our target
- Can we do even better?

© 2004 Pearson Addison-Wesley. All rights reserved

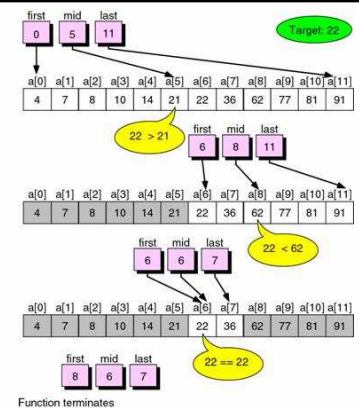

Binary Search

- At each step it splits the remaining array elements into two groups
- Therefore, it is faster than the linear search
- Works only on an already SORTED array
- Thus, there is a performance penalty for sorting the array

[http://web.ics.purdue.edu/~cs154/lectures/lecture011.htm]

Example: Successful Binary Search

[http://web.ics.purdue.edu/~cs154/lectures/lecture011.htm]

Example: BinarySearch.java

© 2004 Pearson Addison-Wesley. All rights reserved

```

while (last >= first)
{
    if (a[mid] == target)
    {
        idx=mid; // Found it!
        break; // exit the while loop
    }
    else if(a[mid] > target)
    {
        // don't search in a[mid] ... a[last]
        last = mid-1;
    }
    else
    {
        // don't search in a[first] ... a[mid]
    }
}

```

Variables

Expression	Value
mid	= 0 int
first	= 0 int
last	= 11 int
target	= 22 int
a[mid]	= 62 int
a[first]	= 22 int
a[last]	= 91 int

Index: 0: 0, 1: 2, 2: 3, 3: 4, 4: 5, 5: 6, 6: 7, 7: 8, 8: 9, 9: 10, 11: 11
 Element a[1]: 4, 7, 8, 10, 14, 21, 22, 26, 62, 77, 81, 91

Analysis of Searching Methods

- For an array of size n
- Sequential Search (Average-Case) $n/2$
- Sequential Search (Worst-Case) n

- Binary Search (Average-Case) $\log(n)/2$
- Binary Search (Worst-Case) $\log(n)$
