Boolean Algebra

George Boole
1815-1864

- **An algebraic structure consists of**
  - **a set of elements {0, 1}**
  - **binary operators {+, •}**
  - **and a unary operator { ' } or { ¯ } or { ~ }**
- **Introduced by George Boole in 1854**
- **An effective means of describing circuits built with switches**
- **A powerful tool that can be used for designing and analyzing logic circuits**

Let's prove the other DeMorgan's theorem

15b. $\overline{x + y} = \bar{x} \bullet \bar{y}$

x	y	$x + y$	$\overline{x + y}$	$\bar{x}$	$\bar{y}$	$\bar{x} \bullet \bar{y}$
0	0	0	1	1		
0	1	1	0	1		
1	0	1	0	0		
1	1	1	0	0		

LHS ($x + y$, $\overline{x + y}$) RHS ($\bar{x}$, $\bar{y}$, $\bar{x} \bullet \bar{y}$)

Let's prove the other DeMorgan's theorem

15b. $\overline{x + y} = \overline{x} \bullet \overline{y}$

x	y	$x + y$	$\overline{x + y}$	$\overline{x}$	$\overline{y}$	$\overline{x} \bullet \overline{y}$
0	0	0	1	1	1	
0	1	1	0	1	0	
1	0	1	0	0	1	
1	1	1	0	0	0	

LHS (columns $x + y$, $\overline{x + y}$) RHS (columns $\overline{x}$, $\overline{y}$, $\overline{x} \bullet \overline{y}$)

Let's prove the other DeMorgan's theorem

15b. $\overline{x + y} = \overline{x} \bullet \overline{y}$

x	y	$x + y$	$\overline{x + y}$	$\overline{x}$	$\overline{y}$	$\overline{x} \bullet \overline{y}$
0	0	0	1	1	1	1
0	1	1	0	1	0	0
1	0	1	0	0	1	0
1	1	1	0	0	0	0

LHS (columns $x + y$ and $\overline{x + y}$) RHS (columns $\overline{x}$, $\overline{y}$ and $\overline{x} \bullet \overline{y}$)

Let's prove the other DeMorgan's theorem

15b. $\overline{x + y} = \bar{x} \bullet \bar{y}$

These two columns are equal, so the theorem is true.

x	y	$x + y$	$\overline{x + y}$	$\bar{x}$	$\bar{y}$	$\bar{x} \bullet \bar{y}$
0	0	0	1	1	1	1
0	1	1	0	1	0	0
1	0	1	0	0	1	0
1	1	1	0	0	0	0

LHS ($x + y$, $\overline{x + y}$) RHS ($\bar{x}$, $\bar{y}$, $\bar{x} \bullet \bar{y}$)

DeMorgan's Theorem
Generalizes to more than 2 variables

$$\overline{x \cdot y \cdot z} = \overline{x} + \overline{y} + \overline{z}$$

$$\overline{x + y + z} = \overline{x} \cdot \overline{y} \cdot \overline{z}$$

DeMorgan's Theorem
Generalizes to more than 2 variables

$$\overline{a \cdot b \cdot c \cdot d} = \overline{a} + \overline{b} + \overline{c} + \overline{d}$$

$$\overline{a + b + c + d} = \overline{a} \cdot \overline{b} \cdot \overline{c} \cdot \overline{d}$$

Try to prove these ones at home

16a. $x + \overline{x} \bullet y = x + y$

16b. $x \bullet (\overline{x} + y) = x \bullet y$

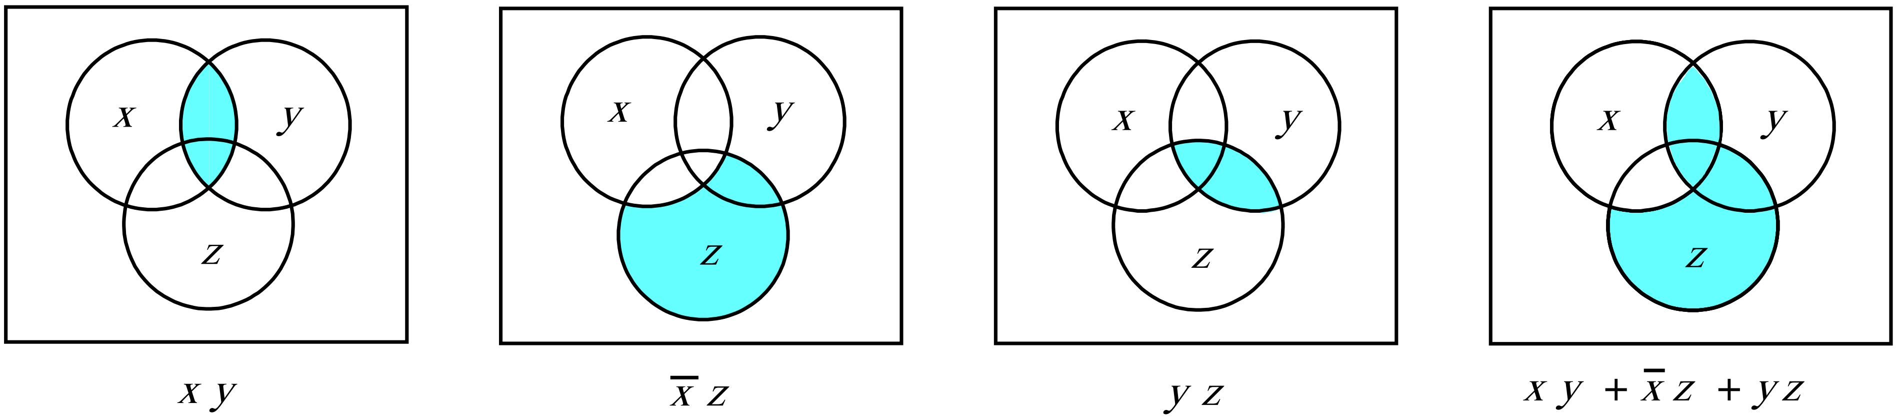
17a. $x \bullet y + y \bullet z + \overline{x} \bullet z = x \bullet y + \overline{x} \bullet z$

17b. $(x+y) \bullet (y+z) \bullet (\overline{x}+z) = (x+y) \bullet (\overline{x}+z)$

Venn Diagram Example
Proof of Property 17a

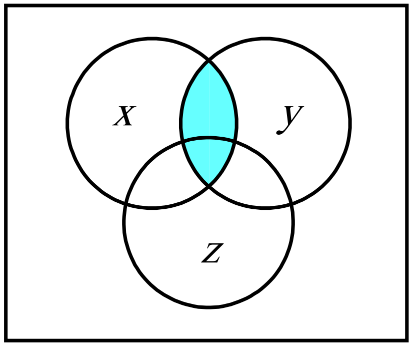
17a. $x \bullet y + y \bullet z + \overline{x} \bullet z = x \bullet y + \overline{x} \bullet z$

Left-Hand Side

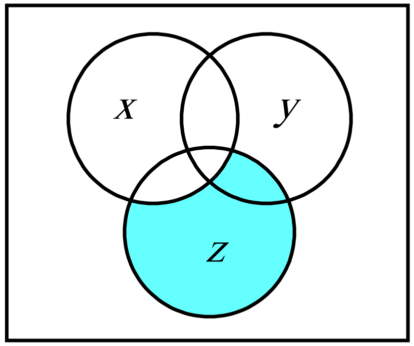


[Figure 2.16 from the textbook]

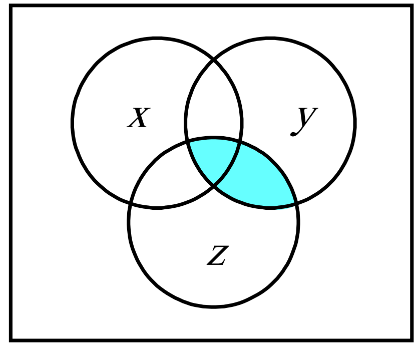
Left-Hand Side



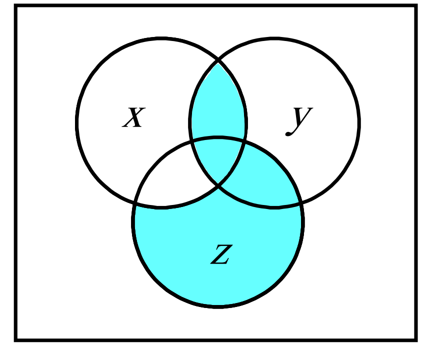
$x y$



$\bar{x} z$

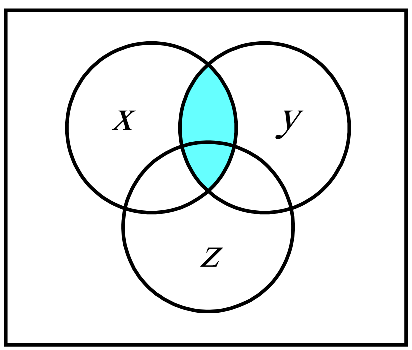


$y z$

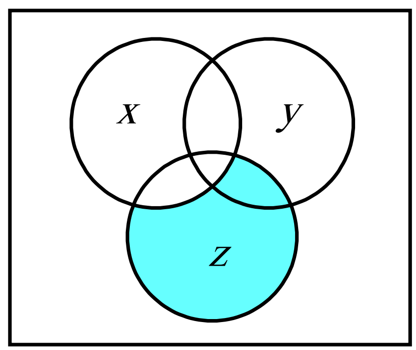


$x y + \bar{x} z + y z$

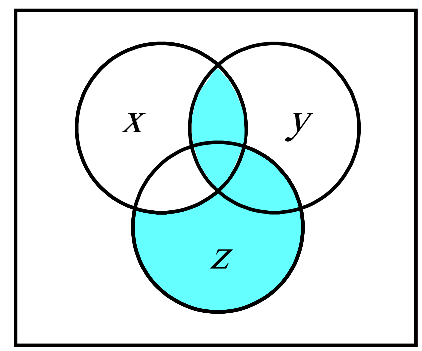
Right-Hand Side



$x y$



$\bar{x} z$

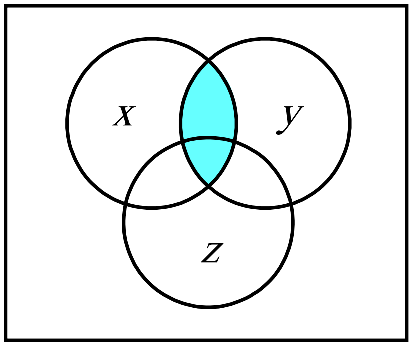


$x y + \bar{x} z$

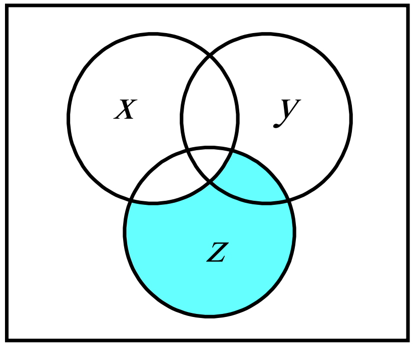
[Figure 2.16 from the textbook]

Left-Hand Side

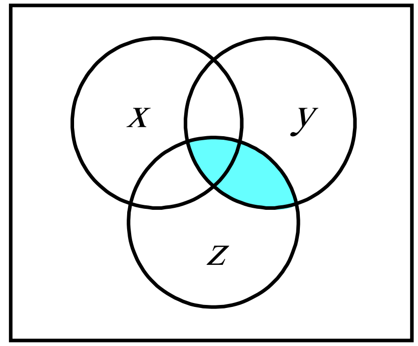
These two are equal



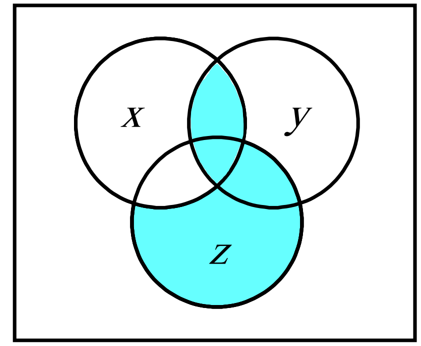
$x\,y$



$\overline{x}\,z$

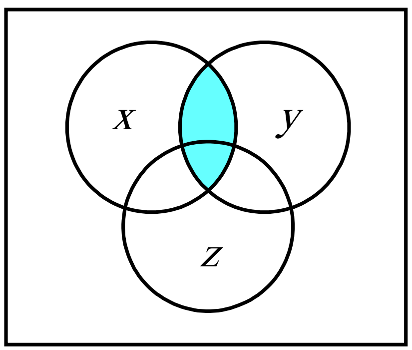


$y\,z$

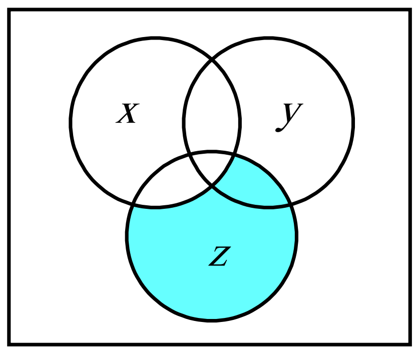


$x\,y + \overline{x}\,z + y\,z$

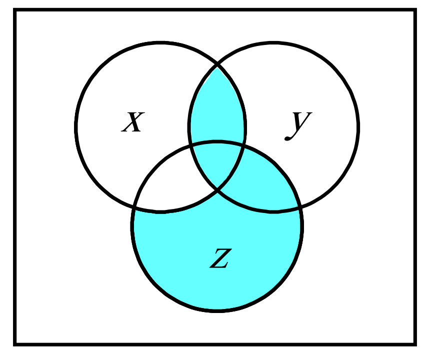
Right-Hand Side



$x\;y$



$\overline{x}\;z$



$x\;y + \overline{x}\;z$
